

I build agents that do the work themselves and never spend anyone's money unasked

Vertex AI • Claude • Gemini • GLM • Kimi • Python • Google Cloud

My product MIRYAS AI is an autonomous agent: it studies the client’s Instagram, writes the ads and launches a real campaign in Meta. It calls Meta Marketing API functions as its tools and lives inside hard limits: a \$50 daily cap , campaigns starting paused, a human confirming. Underneath it is ordinary engineering: Python, FastAPI, queues, PostgreSQL and BigQuery on Google Cloud.

Strengths why hire me

I shipped an AI product to real users

MIRYAS AI is mine end to end: database schema, API, production on Cloud Run, real clients. Not a notebook demo – a working service with money flowing through it.

I give the agent limits, not just a prompt

The agent decides and calls functions on its own, but it cannot spend money without a human: a daily cap, campaigns starting paused, an explicit confirmation. The guardrails are built into the architecture, not bolted on.

I pick the model that fits the task

I compare candidates on answer quality, latency and cost per call: some jobs need the strongest reasoning, others are handled just as well by a cheap fast model.

I know an agent runs on data

Campaign metrics are collected on a schedule, stored in Cloud SQL and BigQuery, and checked for gaps and duplicates. The agent decides on validated data, not raw API responses.

I don't just build agents, I work with them

I develop through agentic tools: Claude Code, Codex, Hermes, Antigravity. I can split a task so an agent can carry it, review its changes, and keep whatever it invented out of production.

Security by default

OAuth instead of passwords, tokens in Secret Manager, keys outside code and .env files.

Experience 2023 – present

MIRYAS AI my own product

2026 – present

meta-ads-agent-v7dho4qhxa-uc.a.run.app ↗

- Designed and shipped an autonomous LLM agent on Vertex AI: it reads the client's profile and product, writes ad copy, picks the audience and calls Meta Marketing API functions as its tools.
- Built the guardrails into the architecture: a \$50 daily cap, every campaign starts paused, no money moves until the client confirms.
- Added Facebook OAuth login: the client's password never passes through the service, access tokens live in Secret Manager.
- Built the metrics pipeline: Cloud Scheduler triggers the jobs, raw Meta responses land in Cloud Storage, parsed metrics in Cloud SQL, and a campaign/creative mart in BigQuery.
- Added data checks before the agent decides: gaps in the reports, duplicates by campaign_id, spend that disagrees with the cap.
- Deployed on Google Cloud: Cloud Run with autoscaling, builds through Cloud Build and Artifact Registry, background work in Cloud Tasks, logs and alerts in Cloud Logging and Monitoring. Interface in three languages.

Backend and data engineer Raqamli Rivojlanish Departamenti, Tashkent

2025 – present
Run REST APIs on FastAPI: 14 services, ~350 requests per second at peak, 150 ms p95, 99.9% uptime.
Build the pipelines analytics runs on: 38 Airflow DAGs collect ~12M rows a day from 17 sources.
Designed PostgreSQL schemas for 9 domains and moved analytics into ClickHouse (900M+ rows): reports build in 1.5 s instead of 40.
Moved heavy work into Celery queues (up to 200k tasks a day); Redis caching cut the API response from 1.2 s to 150 ms.
Validate incoming data: completeness, duplicates, schema conformance. Broken records dropped from 4% to 0.3%.

Python developer

freelance, remote

2023 – 2024

Wrote scrapers and data-collection scripts, cleaned the data in pandas and loaded it into PostgreSQL, Excel and Google Sheets.
Built REST API integrations and Telegram bots for clients' internal work.
Worked with clients directly: gathered requirements, estimated the work and delivered it.
