

Senior Backend Developer

Python · FastAPI · PostgreSQL · Celery · Google Cloud · avtonom AI agentlar

Odamlar haqiqatda foydalanadigan servislarni loyihalayman va yuritaman: REST API va integratsiyalar, navbatlar va kesh, baza sxemalari hamda ularning tezligi. O'z mahsulotim MIRYAS AI — Meta'da reklama kampaniyalarini o'zi yaratib ishga tushiradigan avtonom AI agent — to'liq Google Cloud'da ishlaydi.

Bu sahifa API hujjati ko'rinishida tuzilgan: rezyumening har bo'limi — bitta endpoint. So'rov namunalari shartli, ularni mundarija sifatida o'qing.

Men haqimda

Men haqimda

Backend dasturchi: Toshkent Raqamli rivojlanish departamentida Python va FastAPI servislarini loyihalayman va yuritaman. Ular eng yuqori nuqtada 350 ga yaqin so'rov/sek ni ko'taradi, p95 150 ms, uptime 99,9%.

REST API va 11 ta tashqi tizim bilan integratsiya, Celery va Redis navbatlari, PostgreSQL sxemalari va ularning tezligi, Elasticsearch qidiruvi hamda WebSocket orqali real vaqtdagi uzatish men zimmamda. Servislar Nginx ortida Docker'da ishlaydi, sirlar Vault'da, deploy GitLab CI/CD orqali.

Bundan tashqari o'z mahsulotim MIRYAS AI ni yurityapman: Meta reklamasi uchun avtonom AI agent, to'liq Google Cloud'da joylashtirilgan.

Kuchli tomonlar

Mahsulotni haqiqiy foydalanuvchilargacha yetkazaman

MIRYAS AI ni boshidan oxirigacha o'zim qildim: baza sxemasi, API, Google Cloud'dagi prod va tirik mijozlar. Men trekerdagi vazifa uchun emas, servis ishlashi uchun javob beraman.

Chat ustidagi qobiq emas, avtonom AI agent quraman

Agent o'zi qaror qabul qiladi va funksiyalarni chaqiradi, lekin qattiq cheklovlar ichida: byudjet limiti, kompaniya pauzadan boshlanadi, pul sarflanishidan oldin odam tasdiqlaydi.

Yukni ushlayman va xarajatni nazorat qilaman

Kesh, navbatlar, Cloud Run'da avtomatik masshtablash, har integratsiyada taymout va limitlar. 350 so'rov/sek da p95 150 ms.

Faqat kodni emas, ma'lumotni ham tushunaman

PostgreSQL, ClickHouse, Elasticsearch va Airflow pipeline'lari: vazifani mavjud bazaga moslashtirmay, omborni vazifa ostida loyihalayman.

Xavfsizlik — sukut bo'yicha

OAuth, sirlar Vault va Secret Manager'da, kodda va .env fayllarda parol yo'q.

Uch ish tili

O'zbek, rus va ingliz tillari: jamoa, mijoz va hujjatlar bilan tarjimonsiz ishlayman.

Ish tajribasi

Backend dasturchi

Raqamli Rivojlanish Departamenti

API VA SERVISLAR

- Design and run REST APIs on FastAPI: **14 services**, ~350 requests per second at peak, 150 ms p95, 99.9% uptime.
- Keep the API contract in OpenAPI: pydantic schemas, versioning, backward compatibility on every change.
- Set up authentication and authorization with JWT and OAuth2, with role-based access.
- Connected **11 external systems** over REST; JSON and XML payloads are validated against schemas. Unstable integrations get timeouts and retries with exponential backoff.
- Stream data in real time over WebSocket to the operators' dashboard, under one second of latency.

MA'LUMOT VA TEZLIK

- Designed PostgreSQL schemas for 9 domains with Alembic migrations. Partitioning and indexes made key queries **6× faster**.
- Redis caching cut the internal API response **from 1.2 s to 150 ms**.
- Moved heavy work into Celery queues: up to 200k tasks a day, idempotent, with retries on failure.
- Pushed analytical queries into ClickHouse (900M+ rows): reports build **in 1.5 s instead of 40** and no longer disturb the main database.
- Added full-text search on Elasticsearch across 3M citizen requests, answering in under 200 ms.
- Run recurring background jobs in Apache Airflow: 38 DAGs, 99.6% of runs need no manual work.

INFRATUZILMA VA KOD SIFATI

- Packed 14 services into Docker Compose behind Nginx. A fresh environment comes up **in 10 minutes** instead of half a day.
- Set up GitLab CI/CD: linters, pytest, automatic deploy after code review.
- Moved 60+ passwords and access keys out of code and .env files into HashiCorp Vault.
- Review other people's merge requests and write the documentation new developers use to run the project themselves.
- Handle production incidents through logs and metrics: find the cause, fix it, and leave a guard so it does not happen again.

Python dasturchi, frilans

Masofaviy

2023 – 2024

NIMA QILGANMAN

- Built services and automation to order: REST APIs, integrations with external systems, Telegram bots.
- Wrote Python backends with PostgreSQL, queues and background jobs, and deployed them in Docker.
- Worked with clients directly: gathered requirements, estimated the work and delivered it.

\$50

kunlik byudjet limiti

pauza

har kompaniya shundan
boshlanadi

uz • ru • en

interfeys tillari

Servis kichik biznes uchun reklama agentligini almashtiradi: mijoz Facebook orqali bir marta kiradi, keyin agent uning Instagram'ini o'rganadi, e'lonlarni tayyorlaydi va Meta Ads'da haqiqiy maqsadli kampaniyani ishga tushiradi.

NIMA QILINGAN

- Facebook OAuth orqali kirish: mijoz paroli servis orqali o'tmaydi, kirish tokenlari Secret Manager'da saqlanadi.
- Byudjet cheklavlari: kunlik \$50 limit, har kompaniya pauzada boshlanadi va mijoz tasdiqlamaguncha pul sarflamaydi.
- Meta Marketing API: kompaniya, e'lon guruhlar va kreativlar yaratish, platforma limitlari va xatolarini qayta ishlash, so'rovlarni qayta yuborish.
- Vertex AI orqali LLM ustida avtonom AI agent: profil va mahsulotni o'qiydi, e'lon matnlarini yozadi, auditoriyani tanlaydi va Meta API funksiyalarini o'z asboblari sifatida chaqiradi.
- Google Cloud'da joylashtirilgan: avtomatik masshtablash bilan Cloud Run, baza uchun Cloud SQL, Cloud Build va Artifact Registry orqali yig'ish, fon vazifalari Cloud Tasks va Cloud Scheduler'da, loglar va ogohlantirishlar Cloud Logging va Monitoring'da.
