

Senior Backend Developer

Python · FastAPI · PostgreSQL · Celery · Google Cloud · autonomous AI agents

I design and run services that people actually use: REST APIs and integrations, queues and caching, database schemas and their performance. My own product, MIRYAS AI — an autonomous AI agent that creates and launches Meta ad campaigns on its own — runs entirely on Google Cloud.

This page is laid out as API documentation: every resume section is an endpoint. The request examples are illustrative, read them as a table of contents.

About

About

Backend developer: I design and run Python and FastAPI services at the Digital Development Department of Tashkent. They handle around 350 requests per second at peak, with a p95 of 150 ms and 99.9% uptime.

I own the REST APIs and integrations with 11 external systems, the Celery and Redis queues, PostgreSQL schemas and their performance, Elasticsearch search and real-time delivery over WebSocket. Services run in Docker behind Nginx, secrets live in Vault, releases go through GitLab CI/CD.

On the side I build my own product, MIRYAS AI: an autonomous AI agent for Meta advertising, deployed entirely on Google Cloud.

Strengths

I ship products to real users

MIRYAS AI is mine end to end: database schema, API, production on Google Cloud, live clients. I own the service working, not a ticket being closed.

I build autonomous AI agents, not chat wrappers

The agent decides and calls functions on its own, but inside hard limits: a budget cap, campaigns starting paused, a human confirming before money moves.

I keep services fast and cheap

Caching, queues, autoscaling on Cloud Run, timeouts and limits on every integration. 150 ms p95 at 350 requests per second.

I understand data, not just code

PostgreSQL, ClickHouse, Elasticsearch and Airflow pipelines: I design storage around the task instead of bending the task to fit the database.

Security by default

OAuth, secrets in Vault and Secret Manager, no passwords in code or .env files.

Three working languages

Uzbek, Russian and English: I work with the team, the client and the documentation without a translator.

Digital Development Department, Tashkent • 2025 – present

APIS AND SERVICES

- Design and run REST APIs on FastAPI: **14 services**, ~350 requests per second at peak, 150 ms p95, 99.9% uptime.
- Keep the API contract in OpenAPI: pydantic schemas, versioning, backward compatibility on every change.
- Set up authentication and authorization with JWT and OAuth2, with role-based access.
- Connected **11 external systems** over REST; JSON and XML payloads are validated against schemas. Unstable integrations get timeouts and retries with exponential backoff.
- Stream data in real time over WebSocket to the operators' dashboard, under one second of latency.

DATA AND PERFORMANCE

- Designed PostgreSQL schemas for 9 domains with Alembic migrations. Partitioning and indexes made key queries **6× faster**.
- Redis caching cut the internal API response **from 1.2 s to 150 ms**.
- Moved heavy work into Celery queues: up to 200k tasks a day, idempotent, with retries on failure.
- Pushed analytical queries into ClickHouse (900M+ rows): reports build **in 1.5 s instead of 40** and no longer disturb the main database.
- Added full-text search on Elasticsearch across 3M citizen requests, answering in under 200 ms.
- Run recurring background jobs in Apache Airflow: 38 DAGs, 99.6% of runs need no manual work.

INFRASTRUCTURE AND CODE QUALITY

- Packed 14 services into Docker Compose behind Nginx. A fresh environment comes up **in 10 minutes** instead of half a day.

- Set up GitLab CI/CD: linters, pytest, automatic deploy after code review.
- Moved 60+ passwords and access keys out of code and .env files into HashiCorp Vault.
- Review other people's merge requests and write the documentation new developers use to run the project themselves.
- Handle production incidents through logs and metrics: find the cause, fix it, and leave a guard so it does not happen again.

Python Developer, freelance

Remote

2023 – 2024

WHAT I DID

- Built services and automation to order: REST APIs, integrations with external systems, Telegram bots.
- Wrote Python backends with PostgreSQL, queues and background jobs, and deployed them in Docker.
- Worked with clients directly: gathered requirements, estimated the work and delivered it.

interface languages

The service replaces an ad agency for small businesses: the client logs in through Facebook once, and from there the agent studies their Instagram, prepares the ads

and launches a real targeted campaign in Meta Ads.

WHAT IS BUILT

- Facebook OAuth login: the client's password never passes through the service, access tokens live in Secret Manager.
- Budget guardrails: a \$50 daily cap, and every campaign starts paused and spends nothing until the client confirms.
- Meta Marketing API: creating campaigns, ad sets and creatives, handling platform rate limits and errors, retrying requests.
- An autonomous AI agent on an LLM through Vertex AI: it reads the profile and the product, writes ad copy, picks the audience and calls Meta API functions as its tools.
- Deployed on Google Cloud: Cloud Run with autoscaling, Cloud SQL for the database, builds through Cloud Build and Artifact Registry, background work in Cloud Tasks and Cloud Scheduler, logs and alerts in Cloud Logging and Monitoring.
